

Red Pine Exploration Provides Updated Assays for Cayenne Property, Drilling to Re-Commence in April

March 26, 2014 – Toronto, ON – Red Pine Exploration Inc. (the “Company” or “Red Pine”) (RPX: TSX-V) is pleased to announce that it has received updated assay results from its December 2013 drilling program.

Zinc Assay Results Improve

The updated assay results indicates an intersection of 27.47 metres of 9.36% zinc (“Zn”) including 12.71 meters of 16.51% Zn which replaces the previously reported intersection of 27.47 metres of 8.02% Zn including 12.71 metres of 13.64%. The complete updated assay results are reported below in Chart 1.

Red Pine has completed 2 drilling programs on the property to-date. The December 2013 program, completed just prior to Christmas, included 3 drill holes and 10 additional holes were drilled starting in late January. The assay results for the first program were reported in Red Pine’s press release on January 24, 2014.

Red Pine’s Standard Quality Assurance & Quality Control (“QA/QC”) protocols indicated that the lead assay results reported on the first three holes appeared to be understated through the high grade areas. The Company also indentified that discrepancies in assays of certified reference materials had occurred which resulted in drill results being delayed while these issues were being examined. Samples of certified reference materials are both routinely and randomly inserted into the sample work orders to monitor analytical results.

As a result of these discrepancies, the Company immediately halted all further processing of the high-grade massive sulfide material from the remaining 10 holes pending the validation of the analytical and pulverisation methods for high grade material used by the certified assay lab.

Following standard protocol, the Company also sent both pulp and course reject samples to other accredited assay labs for verification of the results. With the confirmation by all 3 accredited labs that all assay results including lead now fall within acceptable tolerances, the Company is fully satisfied that the lead assay and certified reference material issues have been addressed and rectified.

Pending Assay Results of 2014 Exploration Program

The Company has selected ALS Global to complete the assays and expects to receive all results within the next three weeks. These results will then need to be reviewed and any assays over limit or gold assays will have to be finalized prior to release.

Chart 1: Updated Significant Assay Results from December 2013 Program

Borehole	From (m)	To (m)	Length* (m)	Zinc % (Zn)	Copper % (Cu)	Lead % (Pb)
CC13-01	11	38.47	27.47	9.36	0.41	0.87
includes	23.54	36.25	12.71	16.51	0.81	1.39
	26.53	33.53	7.00	16.47	1.26	1.99
CC13-02	2.26	18.7	16.44	3.83	0.08	0.51
includes	2.26	6.9	4.34	11.63	0.28	1.54

Note: The sampled intervals in Chart 1 are the same as those presented in the January 24, 2014 press release. At the time of today's release the updated silver assays have not yet been received.

Next Scheduled Exploration Program – April 2014

The delay in receiving final analytical results from the recent drill program has forced a delay in the intended mobilization date for our next drill program. The next phase of drilling consisting of 15-20 holes totaling about 4,000 metres will be initiated in April, 2014.

Red Pine QA/QC Protocols for Analytical Testing

Following a thorough review of all quality procedures including the selection of certified reference materials and blanks as well as the sample frequency of these standards used for verifying assay results, the Company is fully satisfied that all assay testing will now fall within allowable standard deviations or tolerances for such test results. The Company will continue to insert certified reference materials and blanks at regular intervals and to assay duplicates at a second accredited lab.

About the Cayenne-Chili Property

- The Cayenne – Chili Property hosts a remobilized VMS System Associated with an adjacent banded iron formation.
- Multiple lenses of mineralization observed in the VenCan zinc showing indicate a stacked sequence of mineralized horizons
- Remobilized Mineralization dips steeply to the North- not to the South as previously interpreted
- Identified new showings with full utilization of Geophysical and Geochemical Data
- Known High Grade Mineralization – assayed values of up to 24.7% Zn, 15.6% Pb and 1.1% Cu from grab samples along the corridor (2013)
- Close to existing infrastructure (rail line, power, all weather roads)

Qualified Person

Quentin Yarie, P.Geo, is the qualified person in regard to the technical data contained within this news release and will be responsible for overseeing all aspects of the Company's exploration programs.

About Red Pine Exploration Inc.

Red Pine Exploration is a gold and base-metals exploration company headquartered in Toronto, Ontario, Canada. The Cayenne Property consists of 4 mining patents and 21 contiguous mining claims totalling 4096 hectares. The Company's common shares trade on the TSX Venture Exchange under the symbol "RPX".

More detailed information about the Company is available on the website: www.redpineexp.com
